# Satellite Control - Then and Now

---

## 10 Years Ago

- Using COTS for Satellite Command and Control systems was considered “crazy”
- Primary requirements of Satellite Control Systems:
  - *Functionality*
  - *Reliability*
  - *Efficiency*
  - *Cost*

## NOW

- “Off the shelf” solutions are “common” in multiple phases of the satellite industry
- Primary requirements of Satellite Control Systems
  - *Functionality*
  - *Reliability*
  - *Efficiency*
  - *Cost*

**The difference in requirements is defined mostly by how the results are achieved and the relative requirement priorities**

# Current Control System Priorities

---

- **Efficient Utilization of COTS**

- *COTS based solutions are “here to stay”*
- *Reduce acquisition and maintenance costs*
- *Avoid unnecessary development costs required to create new software that might already exist*
- *Challenge is to manage customer/vendor expectations, satisfy mission unique requirements and support customer administrative needs*

- **Satellite Control Automation**

- *Improve operational efficiency, reduce errors, improve reaction time, improve operator morale*
- *Consistent with the effort to improve efficiency, reliability and cost*
- *Challenge is to balance automation with end user comfort*

- **Fleet Monitor and Control**

- *More owner/operators are moving to a multi-satellite capability*
- *Need to improve efficiency of control system for multiple satellites*
- *Challenge is to control “more with less” without reducing or risking reliability and efficiency*

# Efficient Utilization of COTS

---

*“Success or failure with COTS systems depends on understanding and adapting to the constraints, challenges, and opportunities of this environment.”*

*- Col. Ralph D. Monfort, USAF, Space and Missile System Center*

- **If you’ve had success with COTS, then you probably...**
  - ***Have a strong technical staff committed to understanding/developing requirements***
  - ***Can describe what need and want the system to do but are open to “how” the system will do it***
  - ***Are capable and willing to work with vendors to perform tradeoffs on requirements, ops concepts and capabilities***
  - ***Are willing to plan and coordinate system upgrades throughout the life of the mission.***

# Efficient Utilization of COTS

---

## Early (important) decisions...

- **Partnership with supplier vs. classic “customer/vendor” relationship**
- **Loosely vs. tightly integrated solution**
- **Is a 70-80% off-the-shelf capability....**
  - *“Good Enough”*
  - *“the foundation for a complete solution”*

# Satellite Control Automation

---

Effective automation provides multiple benefits...

- **Operational costs savings**
  - *Fewer staff to support more on-station assets*
- **Improved efficiency of operations staff**
  - *Operators focus more on critical/important tasks vs. repetitive/mundane tasks*
  - *Operator interest and motivation is improved*
- **Reduced error potential**
  - *Significant reduction in the chance of an operator error*
  - *Reduction of repetitive, boring and mundane activities*

# Inmarsat Ltd. – A Success Story

---

- **Success story for both Automation and effective use of COTS**
- **Established in 1979 as an Inter-governmental organization (IGO)**
  - *In April 1999, Inmarsat transitioned to a private limited company, Inmarsat Limited*
  - *Service portfolio includes maritime (including safety and distress applications), aeronautical and land mobile. Over 180,000 Inmarsat terminals in use world-wide*
- **Satellite Constellation**
  - *Four Inmarsat-2 satellites (MMS/Astrium Eurostar), launched 1990-1992*
  - *Five Inmarsat-3 satellites (LM 4000), launched 1996-1998*
  - *Recently ordered three Inmarsat-4 satellites (Astrium Eurostar 3000)*
- **Established “cooperative agreement” with L-3 Storm**
  - *Combine Inmarsat operations expertise with L-3 Storm technology*
  - *Leverage Inmarsat/L-3 Storm development efforts across multiple programs*

# Inmarsat's Approach and Results

---

- Formed a small core engineering team to define SCC automation requirements for existing, well understood Inmarsat-2 class of satellites
- Performed Technical Validation Program - “Fly before Buy”
- Selected vendor/partner
- Automated Inmarsat-2 satellite operations
- Added each Inmarsat-3 satellite while incrementally migrating their daily and seasonal operations to an automated approach
- Results:
  - *Added all five Inmarsat-3 satellites and associated ground equipment while cutting satellite operations staff in half.*
  - *Have applied similar automation to network control applications further reducing staff requirements*

# Fleet Monitor and Control

---

## Critical items for effective Fleet Monitor and Control ...

- **Ability to concurrently monitor and control multiple assets from a single workstation**
- **Effective graphical user interface design**
- **Effective automation capabilities**
- **Ability to “take control” and “hand off” satellites to support health and maintenance commanding or to handle a specific problem**

# Fleet Monitor and Control User Interface

The screenshot displays the Fleet View software interface, which is used for monitoring and controlling a fleet of satellites. The interface is divided into several sections:

- Fleet View:** A top row of 13 satellite icons, each with a label and the name 'isis'. The labels are BA1, GIR, GV, GVI, GIX, S6, GIIIR, GVII, O3, GIVR, GXR, GIIC, GXI, and SC2.
- Log Window:** A window titled 'AbsApp - untitled.ppp' showing a log of system messages. The messages include timestamps and error codes, such as '2000/05/10 20:17:50 P2 Unable to retrieve information for a 2773 command. Return code = 90' and 'Failed to connect to the CORBALink DB, will automatically retry in 10 seconds.'
- Resource View:** A tree view showing the system's resources, including 'G4' and 'G5'. Under 'G4', there are several processes listed, such as 'I3-MONITOR-SAS-STATUS-1', 'I3-MONITOR-PIVOT-REDMANF...', 'I3-MONITOR-PIVOT-FAILURE-1', 'I3-04-ACCS-HEALTH-CHECK-1', 'I3-MONITOR-SAS-TIMER-3', 'I3-RIFP-FAILURE-3', and 'I3-MONITOR-CDD-TIMERS-3'.
- Flowchart:** A central window showing a flowchart for 'I3-RIFP-FAILURE-3'. The flowchart includes steps like 'Disable Commanding', 'Monitoring I3-RIFP-FAILURE-3', and 'Add I3-RIFP-FAILURE-3 HEALTH CHECKS'. It also shows decision points for 'I3-RIFP-FAILURE-3' and 'I3-MONITOR-SAS-TIMER-3'.
- Execution Overview:** A table at the bottom showing the execution status of various procedures. The table has columns for 'GV-ID', 'Procedure ID', 'LB', 'RP', 'Exec. Mode', 'KB', 'Date', 'Time', and 'Spawn'.

GV-ID	Procedure ID	LB	RP	Exec. Mode	KB	Date	Time	Spawn
05	I3-04-ACCS-HEALTH-CHECK-1	BAD	NO	AUTOMATIC	NO	2000/05/10	20:06:06	NO
05	I3-RIFP-FAILURE-4	BAD	NO	AUTOMATIC	NO	2000/05/10	20:06:18	NO
04	I3-MONITOR-CDD-TIMERS-3	GOOD	NO	AUTOMATIC	NO	2000/05/10	20:06:38	NO
04	I3-RIFP-FAILURE-3	GOOD	NO	AUTOMATIC	NO	2000/05/10	20:06:41	NO
04	I3-RIFP-FAILURE-3	GOOD	NO	AUTOMATIC	NO	2000/05/10	20:06:45	NO
04	I3-MONITOR-SAS-TIMER-3	GOOD	NO	AUTOMATIC	NO	2000/05/10	20:06:49	NO
04	I3-04-ACCS-HEALTH-CHECK-1	GOOD	NO	AUTOMATIC	NO	2000/05/10	20:06:52	NO
04	I3-MONITOR-PIVOT-FAILURE-1	GOOD	NO	AUTOMATIC	NO	2000/05/10	20:06:55	NO
04	I3-MONITOR-PIVOT-REDMANF...	GOOD	NO	AUTOMATIC	NO	2000/05/10	20:06:59	NO
04	I3-MONITOR-SAS-STATUS-1	GOOD	NO	AUTOMATIC	NO	2000/05/10	20:07:02	NO

---

# Specific Architectural Activities

# L-3 Storm Architectural Evolution

---

- **Multiple Goals**

- *Increase the commonality of fielded systems*
- *Improve training and maintenance costs*
- *Provide better value for customers*

- **Specific Actions**

- *Definition of use cases for all current and future customers*
  - **Focus on “users”**
  - **User-centric approach vs. system-centric**
- *Focus on well defined interfaces and clear component definitions*
- *Integrate a distributed, object-oriented approach based on CORBA*
- *Provide a “single system GUI” using Java*

# Implement Strong Building Blocks

---

- **Strata**

- *Core (CORE)*
- *Site (SITE)*
- *Entity (ENTY)*
- *Program (PROG)*

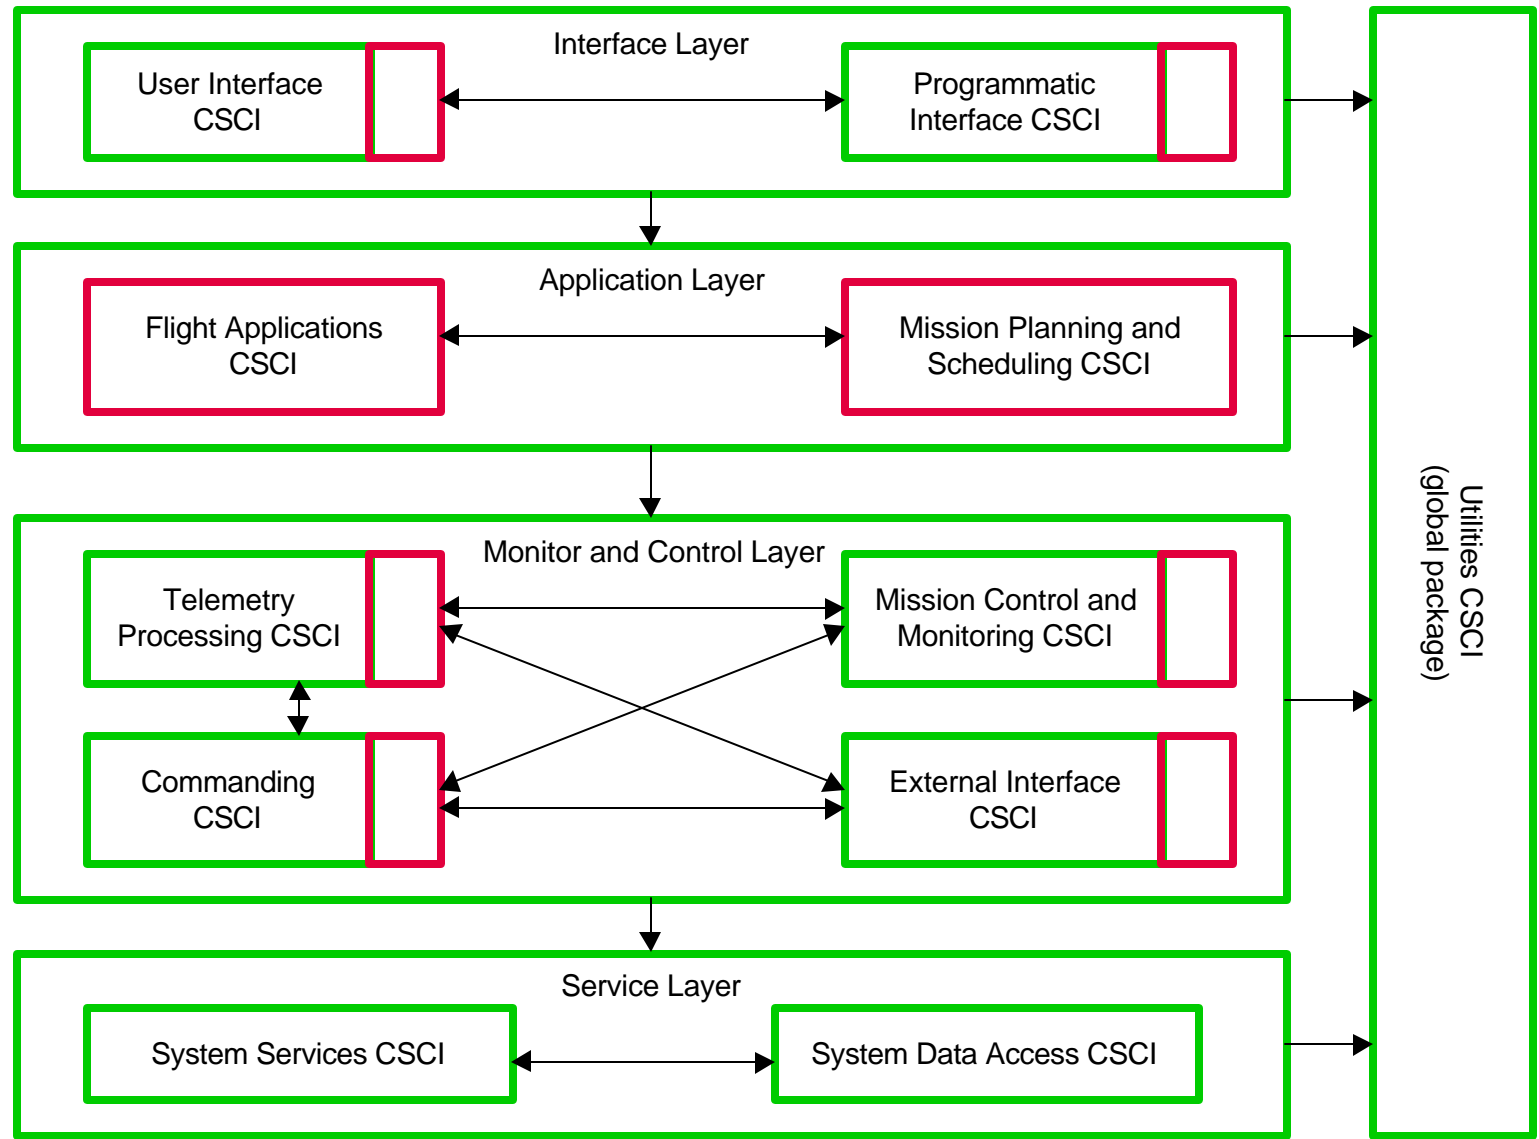

- **Layers**

- *Interface (IF)*
- *Application (AP)*
- *Monitor and Control (MC)*
- *Service (SR)*

- **Computer Software Configuration Items (CSCIs)**

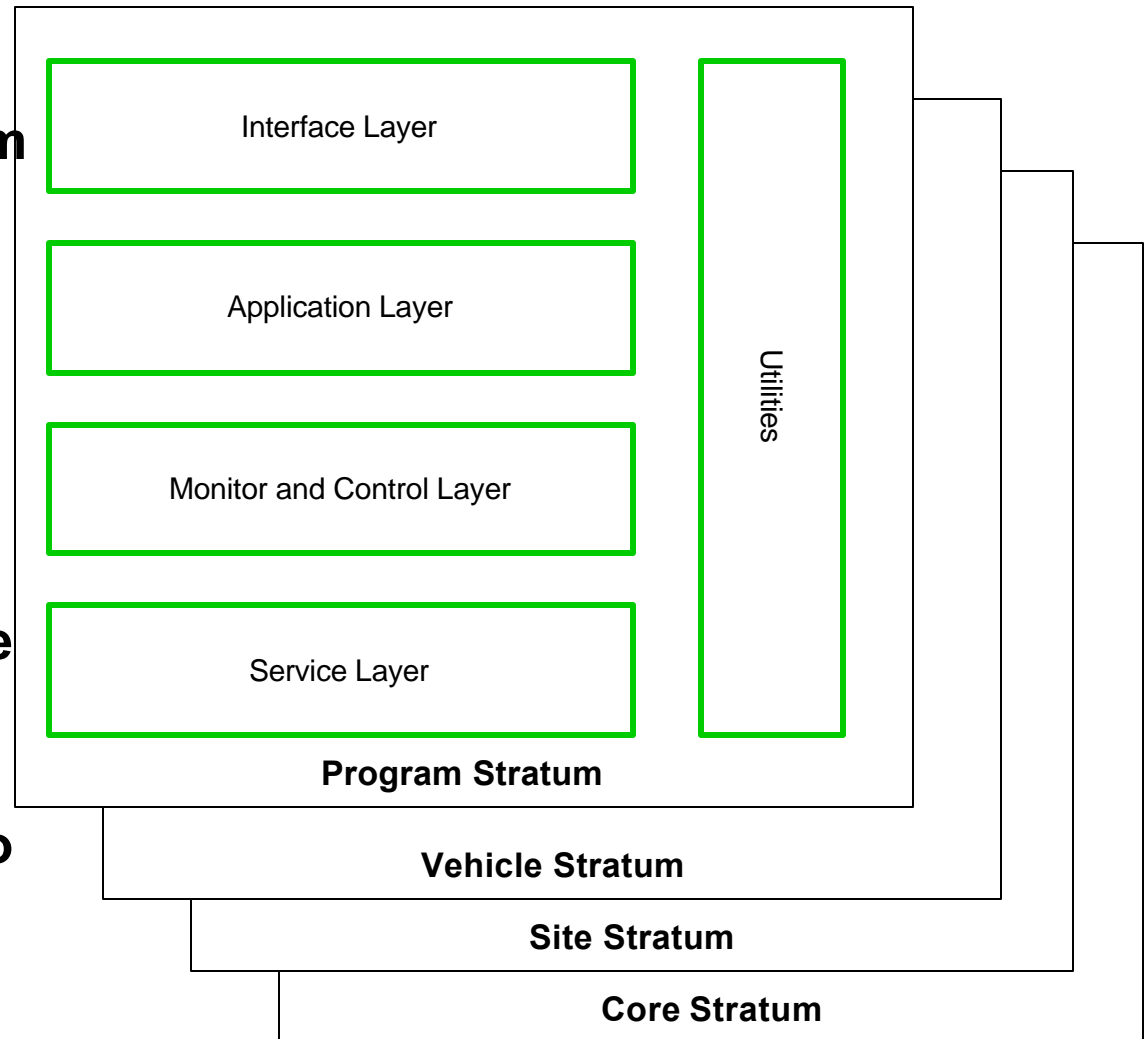

- *User Interface (GUI)*
- *Programmatic Interface (API)*
- *Mission Planning and Scheduling (MPS)*
- *Flight Applications (FLT)*
- *Mission Monitor and Control (MCM)*
- *Commanding (CMD)*
- *Telemetry (TLM)*
- *External Interface (XIF)*
- *System Data Access (SDA)*
- *System Services (SYS)*
- *Utilities (UTL)*

# Architectural Layers and CSCIs

# Architectural “Strata”

- **Allows hierarchical customizations to system**
- **Functionality at Program stratum overrides Vehicle, which overrides Site, etc.**
- **The same layers and CSCIs exist in all strata**
- **Layers and CSCIs can be empty in a stratum**
- **Not all strata need be present for the system to work**
- **Applies to database as well as code**

# L-3 System Instance (example)

# Analysis Mechanisms/Design Patterns

---

- A set of abstractions that work together to carry out common and interesting behavior
- Builds support for such non-functional requirements directly into the architecture
- Reduces complexity of analysis and improves its consistency by providing developers with a short-hand representation of complex behavior
- Typical patterns:
  - *Process Activation*
  - *Multiple Mission Operations*
  - *Distribution/Communication*
  - *Persistence*
  - *Resource Management*
  - *On-line Definitional Changes*
  - *Multiple Operational Phases*
  - *Checkpoint/Restart*
  - *Fault Tolerance*
  - *Error Handling and Reporting*
  - *Authorization/Security*

# Last Chart...

---

- **Summary**

- *COTS software can provide significant cost savings for space applications*
- *To effectively take advantage of COTS software, satellite operators must be flexible and adjust to a COTS procurement and ongoing support paradigm*
- *If possible, pick a “partner” not just a vendor*
- *If you are successful with the above, you can really save money through the intelligent use of automation*

- **The future...**

- *Those operators who have flexibility and are willing to invest time, effort, and money to automate their operations can realize significant mission cost savings*
- *Those who do it best can turn their satellite operations “cost” centers into “profit” centers by offering satellite launch and fly satellites for other satellite service providers*
