

Strategies for Successful Component-based Development

**John Ohlinger
CCT Program Manager
National Reconnaissance Office**

Ohlinge@NRO.mil

Agenda

- ◆ **Background on a New Approach**
- ◆ **Challenges We Faced**
- ◆ **Discovered Strategies**
- ◆ **Lessons Learned**
- ◆ **On-going Work**

Background on New Approach

- ◆ **Conducted a feasibility study that identified significant functional overlap in CC domain**
(reported GSAW98)
- ◆ **We felt reusable component-based development approach could save time and money**
- ◆ **Sought an open reusable component toolkit for Command and Control Domain**
 - ◆ Reference architecture
 - ◆ Reusable components
 - ◆ Documentation

Challenges we faced

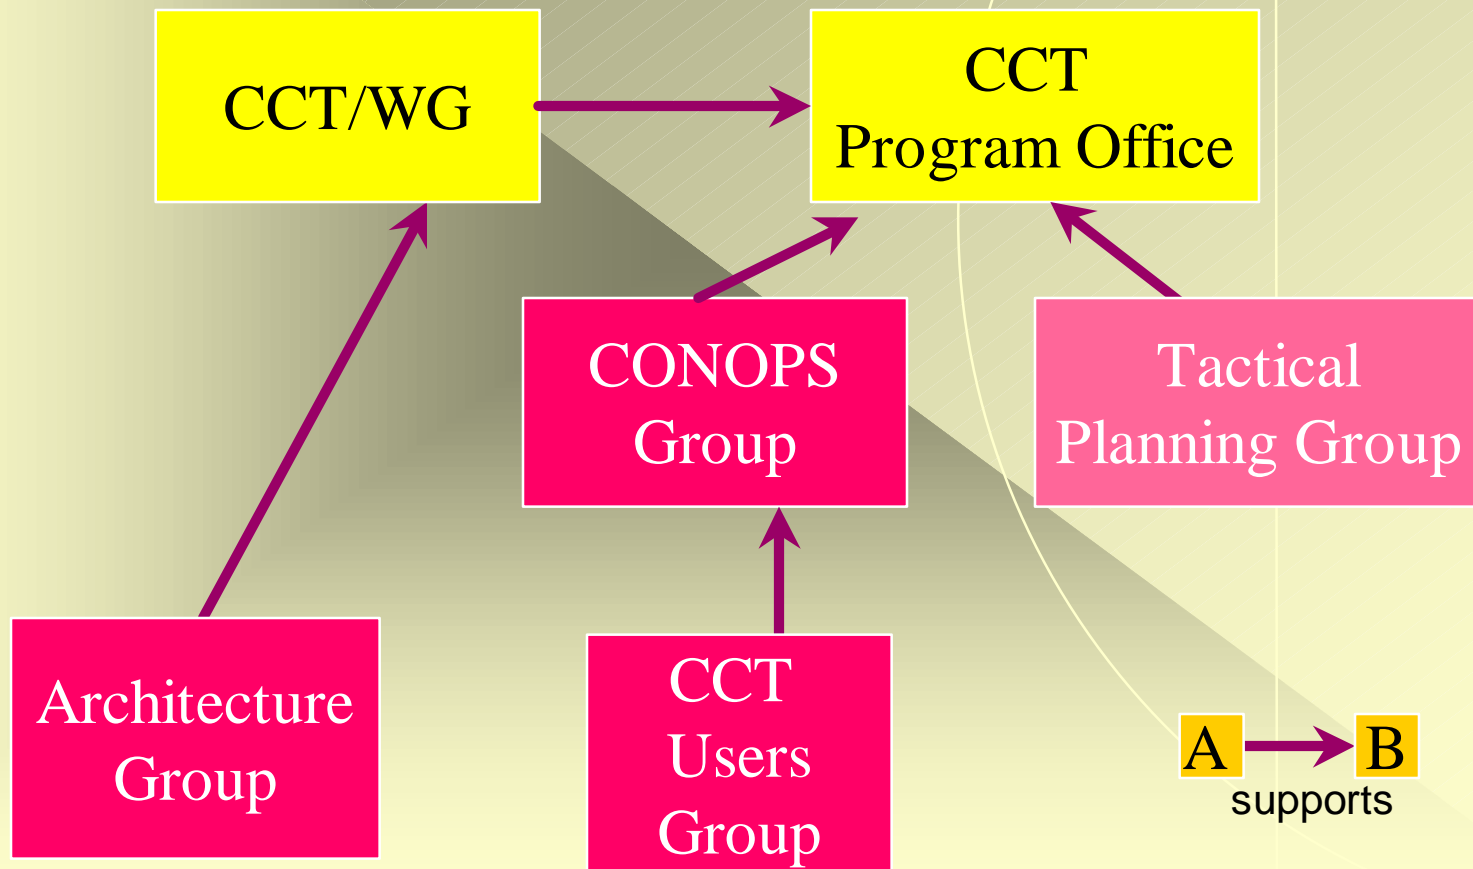

- ◆ **Programmatics geared toward classic “point-solutions”**
- ◆ **Concerns that the reuse artifacts would not be sufficient for independent development**
- ◆ **Schedule was challenge**
- ◆ **Balancing long-term reference architecture needs vs short-term development progress**
- ◆ **Need to not only develop for current customer, but promote reuse within our organization**

Discovered Strategies:

Introduction

- ◆ **Strategies grew out of concerns and challenges in developing a product-line approach**
- ◆ **We needed some way to manage our new technical and organizational goals.**
- ◆ **Result was creation of Program Office working groups...**
- ◆ **...and a plan to monitor their effectiveness**

Working Groups

Discovered Strategies:

Develop an architectural group to manage technical evolution

- ◆ **Symptoms:**
 - ◆ **Certain architectural issues were found to be outside the contractors scope**
 - ◆ **Architectural problems were often revisited/delayed/revisited**
- ◆ **Results:**
 - ◆ **Forum established to look at problems in depth**
 - ◆ **Consensus-based architectural agreements for classes of problems are being addressed and documented**
 - ◆ **Recommendations are structured to facilitate management**
 - ◆ **Better ability to address major concerns vs minor defects**
 - ◆ **Subgroups work key (hot) issues**

Discovered Strategies:

Develop short-term (tactical) plan to promote component-based reuse beyond current customer

- ◆ **Tactical Plan Strategies:**
 - ◆ Launch another system using our artifacts
 - ◆ Coordinate with NRO strategic goals
 - ◆ Mature our assets
 - ◆ Increase our exposure
- ◆ **To carry these strategies out successfully:**
 - ◆ Define metrics to monitor progress
 - ◆ Work with others to gain better perspective of their needs and concerns
 - ◆ Recognize we are part of a larger picture in which our reference architecture for CC provides an important part
 - ◆ To encourage progress in other domains need to address long-term issues of business-case needs and contractor buy-in

Discovered Strategies:

Develop a Program CONOPS to foster continued success

- ◆ **Interoperability**
 - ◆ Provide guidelines for conformance to reference architecture
- ◆ **Provide high level roadmap for the program**
- ◆ **Identify reuse processes**

Lessons Learned

- ◆ **Reference architecture is alive**
 - ◆ Decoupling the reference architecture from target “design” architectures implies an organizational ownership that will manage its evolution
 - ◆ Incremental releases worked well
 - ◆ Needed to revisit our reference architecture representation
 - ◆ Schedule exacerbated weak areas
- ◆ **Evolution of artifacts for reuse takes time and thought**
 - ◆ Distinguish between near-term and long-term issues helpful to focus efforts

Lessons Learned

- ◆ **Architectural reviews started late in our process**
 - ◆ A tool to help architecture development should start early
- ◆ **Definition of technical concepts essential**
 - ◆ Avoid misunderstandings between commonly used terms
- ◆ **Verification of system level performance**
 - ◆ Physical models
- ◆ **Architectural conformance**
 - ◆ What does it mean

On-going Work

- ◆ **Technical:**

- ◆ **Continuing incremental releases**
- ◆ **Independent “vertical slice” approach to assess artifact completeness and navigability**
- ◆ **Performance assessment methodology using components in different scenarios**
- ◆ **Managing interfaces and component deployment**

- ◆ **Organizational:**

- ◆ **Implementation of the Tactical Plan**
- ◆ **Interaction with others**
 - ◆ **SOTG**
